

System Service Kits

System Service Kits Include:

- Accumulator/Receiver Drier/Desiccant Bag
- Expansion Device/Orifice Tube
- Rear Expansion Device (if equipped)
- O-Ring Rapid Seal Kit (unless otherwise noted)

Pair your OE or aftermarket compressor and/or evaporator with a gpd System Service Kit.

Every time the A/C system is opened, the accumulator/drier should be replaced.

The accumulator/receiver drier is designed to remove small amounts of moisture from the A/C system and also functions as a storage tank for refrigerant. If exposed to ambient air, the moisture absorbing desiccant inside will be ineffective.

When installing a new evaporator, it is highly recommended to replace the expansion device/orifice tube. If the expansion device/orifice tube is damaged or clogged, the evaporator will not receive the proper amount of refrigerant, causing the A/C system to fail again.
